

KDIA Re Park

Platform Architecture & Workflow Alignment – Change Log

Date: 16-01-2026

Scope: Customer Portal, Vendor Portal, Admin Portal

Objective: Align the platform with KDIA's finalized business philosophy and operational constraints.

1. Strategic Shift in Platform Philosophy

Previously, parts of the platform were built on assumed capabilities such as:

- Customer self-service onboarding
- Energy usage tracking
- Consumption-based insights and optimization

New Confirmed Philosophy:

- KDIA provides **managed solar energy allocation**, not energy monitoring.
- **Vendors (salespersons)** handle customer onboarding in person.
- **Admin approval** is mandatory for vendors and customers.
- **Electricity consumption is not tracked** by KDIA.
- **DISCOM** issues electricity bills; KDIA only assigns solar allocation.
- Customer portals are **informational and support-oriented**, not analytical.

2. Customer Portal Changes

2.1 Dashboard Repositioning

- Reframed the Customer Dashboard from an energy monitoring interface to a **Managed Clean Energy Service Portal**.

- Updated hero messaging to:
 - Remove system-level or technical language
 - Emphasize reassurance, service continuity, and KDIA-managed operations
- Introduced clear messaging stating:
 - Allocation is managed by KDIA
 - Customer cannot modify or monitor energy usage

2.2 Removal of Consumption & Monitoring Elements

- Removed all UI components implying:
 - Real-time electricity usage
 - Consumption tracking
 - Savings calculations
 - Usage graphs or progress indicators
- Ensured no residual copy references consumption or optimization.

2.3 Energy Allocation Representation

- Retained allocation summary cards but clarified:
 - Allocation represents **assigned solar energy**, not usage
 - Allocation is **monthly**
 - Allocation is **assigned and modified only by KDIA**
- Added explicit guidance directing users to Support for allocation changes.

2.4 Language Consistency

- Replaced customer-facing terms implying:
 - Monitoring
 - Consumption
 - Optimization
- Standardized terminology around:

- Allocation
- Service status
- Support & assistance

2.5 Support-Centric UX

- Elevated the Support & Help section as a primary dashboard action.
- Clarified support scope:
 - Allocation queries
 - Billing clarification
 - General assistance
- Ensured ticketing is the only interactive workflow for customers.

3. Vendor Portal Implementation

3.1 New Vendor Portal (Separate Namespace)

- Introduced a fully isolated Vendor Portal with:
 - `/vendor/login`
 - `/vendor/register`
 - `/vendor/dashboard`
- Vendor access is completely separated from Customer and Admin portals.

3.2 Vendor Model Clarification

- Defined vendors as **individual salespersons**, not companies.
- Updated all vendor-facing copy accordingly:
 - "Salesperson Registration"
 - "Apply as a KDIA Sales Partner"

3.3 Vendor Approval Workflow

- Vendors can register but default to:

- `approval_status = PENDING`
- Vendors cannot access dashboards until approved by Admin.
- Introduced a Vendor Pending screen explaining approval process.

3.4 Vendor Dashboard (Phase-Safe Skeleton)

- Implemented a structured but non-functional dashboard containing:
 - Assigned Leads (placeholder)
 - Customers Onboarded (placeholder)
 - Pending Actions (placeholder)
- Added empty-state messaging explaining future data availability.
- No business logic, data mutation, or lead workflows implemented yet.

3.5 Vendor Leads Section

- Added a read-only Leads page:
 - No create/edit/delete actions
 - Clear empty-state messaging
- Leads will be assigned only by Admin in future phases.

4. Admin Portal Refactoring (Philosophy Alignment)

4.1 Dashboard Reframing

- Repositioned Admin Dashboard from:
 - "Infrastructure Command Center"
 - To **Service Operations Dashboard**
- Removed consumption and prediction-based KPIs:
 - Total Energy Consumed
 - Under-utilized Allocations
 - High-risk Allocation Customers

- Replaced efficiency indicators with service-health positioning.

4.2 Consumption Module Reinterpretation

- Renamed Consumption module to reflect:
 - DISCOM-provided data
 - Administrative reference only
- Added explicit disclaimers:
 - KDIA does not track or monitor consumption
 - Imported data is for reconciliation only

4.3 Alert & Action Cleanup

- Removed alerts based on consumption behavior.
- Retained alerts focused on:
 - Pending approvals
 - Support requests
 - Profile change requests

5. Vendor Management – Admin Review Workflow

5.1 Vendor Management Module

- Added Vendor Management section in Admin Portal.
- Displays:
 - Vendor identity
 - Application date
 - Approval status
 - Account status

5.2 Vendor Application Review

- Implemented “Review Application” action:

- Navigates to a detailed Vendor Review page
- Admin can:
 - Approve Sales Partner
 - Reject Application (with mandatory reason)
- Approval updates vendor access permissions.
- Rejection reasons are stored for audit visibility.

5.3 Audit Logging

- All vendor approval decisions are logged with:
 - Admin identity
 - Vendor ID
 - Timestamp
 - Action taken (Approved / Rejected)
 - Rejection reason (if applicable)

6. Architectural Outcomes

- Platform now reflects **real-world operational constraints**
- Clear separation of responsibilities:
 - Vendor → onboarding & sales
 - Admin → approvals & allocation
 - Customer → visibility & support
- Eliminated misleading assumptions before scaling workflows
- System is now **Phase 6B ready** (Customer Approval & Allocation Assignment)
